Lecture 10
Storage and Indexing

Semester 2 2018, Week 5

Organisational Description and Problem Area

An investment bank wants to have a database to provide it with the ability to store information about its trading operations. The bank essentially works with customers by providing the capability for trading stocks, shares and other commodities. The bank has three branches in which exist a number of departments. Departments have a department manager who supervises a number of staff within the department. A set of accounts are used to store information about the currency of the organisations operations. Accounts can be customer accounts or internal "house" accounts, each of which allow trades to be made upon them. There are a number of account types. There are many customers and customers may have one or more contacts. Customers have a facility for lending money to pay for their purchases of stocks and commodities. Staff make deals on the behalf of their customers using a funding source and keeping track of settlements on the deals being made. There are many types of deal to be made. Settlements are full or partial payments of the deals and are recorded whenever a payment is made.

Please note that this section is purely made up and by all means is a very short description of a real investment bank (although many details have been left out and wide ranging assumptions have been made).

Database System

Components of a DBMS

This is one of several possible architectures; each system has its own slight variations.

Database **TODAY**

- File organization (Heap & sorted files)
 - Index files & indexes
 - Index classification
- Assignment Project Exam Help
- <https://powcoder.com>
- Add WeChat powcoder

Readings: Chapter 8, Ramakrishnan & Gehrke, Database Systems

- **FILE:** A collection of **pages**, each containing a collection of **records**.

- DBMS must support:
 - insert/delete/modify record
 - read a particular record (specified using *record id*)
 - scan all records (possibly with some conditions on the records to be retrieved)

Add WeChat powcoder

- Many alternatives exist, *each good for some situations, and not so good in others*:
 1. **Heap files**: no particular order among records
 - Suitable when typical access is a file scan retrieving **all** records
 2. **Sorted Files**: pages and records within pages are ordered by some condition
 - Best for retrieval (of a range of records) in some order
 3. **Index File Organizations**:
 - Special data structure that has the fastest retrieval in some order
 - Will cover shortly..

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

1. Heap (Unordered) Files

- Simplest file structure, contains records in **no** particular order
- As file grows and shrinks, disk pages are allocated and de-allocated

Assignment Project Exam Help
–Fastest for inserts compared to other alternatives

<https://powcoder.com>

Add WeChat powcoder

Used to denote that pages are linked

- Similar structure like heap files (pages and records), but pages and records are **ordered**
- Fast for range queries, but hard for maintenance (each insert potentially reshuffles records)
- **Example:** A sorted file ordered by age

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- DBMS model the **cost** of all operations
- The cost is typically expressed in **the number of page accesses** (or disk I/O operations)
 - 1 page access (on disk) == 1 I/O (used interchangeably)

Assignment Project Exam Help

- **Example:** If we have a table of 100 records, and each page can store 10 records, what would be the cost of accessing the entire file
- **Answer:** For 100 records we have 10 pages in total (100/10), thus the cost to access the entire file is 10 I/O (or 10 pages)

<https://powcoder.com>

Add WeChat powcoder

- **Example:** Find all records with ages between 20 and 30, for the file that has B pages. Consider both alternative: having an unsorted and sorted file. What would be the cheapest cost?

- $20 < \text{age} < 30$, num pages = B

- Heap file (no order) = B ,

RELEVANCE

- File organization (Heap & sorted files)
- Index files & indexes

Assignment Project Exam Help

- Index classification

<https://powcoder.com>

Add WeChat powcoder

- Sometimes, we want to retrieve records by specifying the *values in one or more fields*, e.g.,
 - Find all students in the “**CIS**” department
 - Find all students with a **gpa** > 3

Assignment Project Exam Help

- An **index** is a data structure built on top of data pages used for efficient search. The index is built over specific fields called **search key fields**. E.g. we can build an index on **GPA**, or **department name**.
 - The index speeds up selections on the *search key fields*
 - **Any** subset of the fields of a relation can be the search key for an index on the relation
 - **Note:** *Search key* is not the same as **key** (e.g., doesn't have to be unique)

<https://powcoder.com>

Add WeChat powcoder

Example: Simple Index on GPA

An index contains a collection of **data entries**, and supports efficient retrieval of **data records** matching a given **search condition**

$2 < \text{GPA} < 2.4$

Assignment Project Exam Help

Directory
Smaller than ← 2 2.5 3 3.5
Larger/equal than →

Data Records
In Data Pages

Find results

- File organization (Heap & sorted files)
- Index files & indexes

Assignment Project Exam Help

- Index classification

<https://powcoder.com>

Add WeChat powcoder

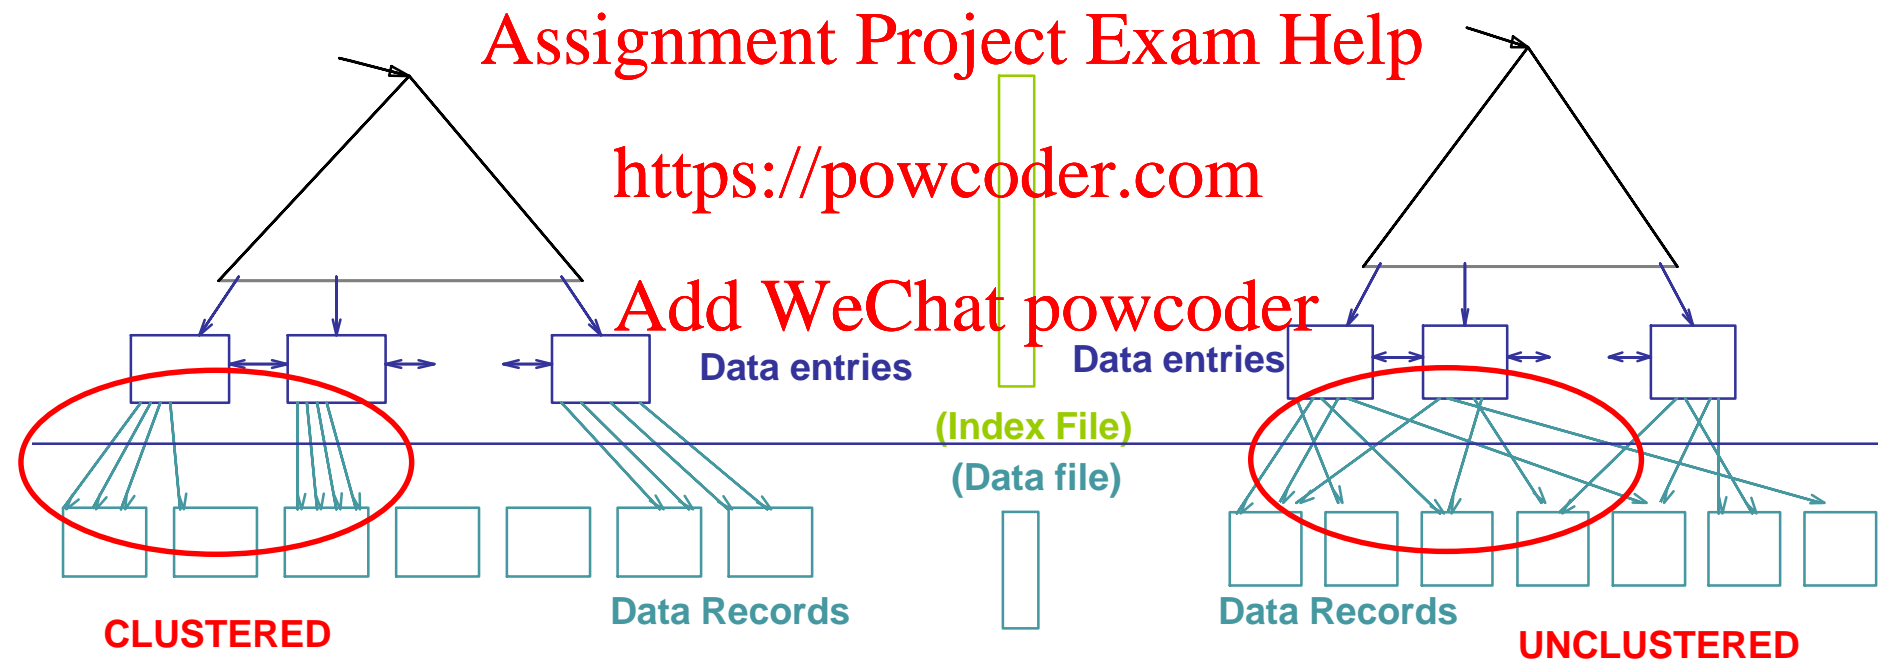

- Classification based on various factors:
 - Clustered vs. Unclustered
 - Primary vs. Secondary
 - Single Key vs. Composite
 - Indexing technique:
 - Tree-based, hash-based, other
- Assignment Project Exam Help
<https://powcoder.com>
Add WeChat powcoder

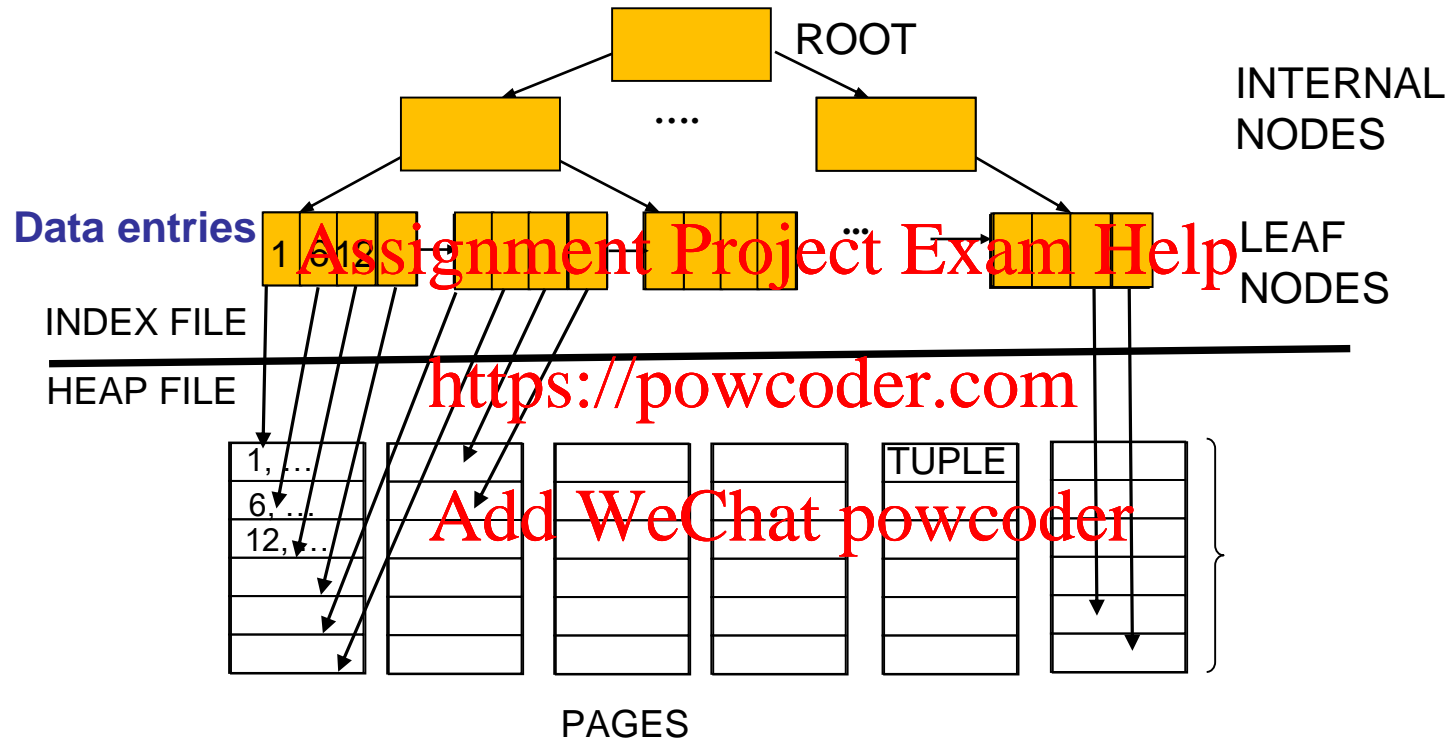

- **Clustered vs. unclustered:** If order of **data records** is the same as the order of **index data entries**, then the index is called **clustered index**. Otherwise is **unclustered**.

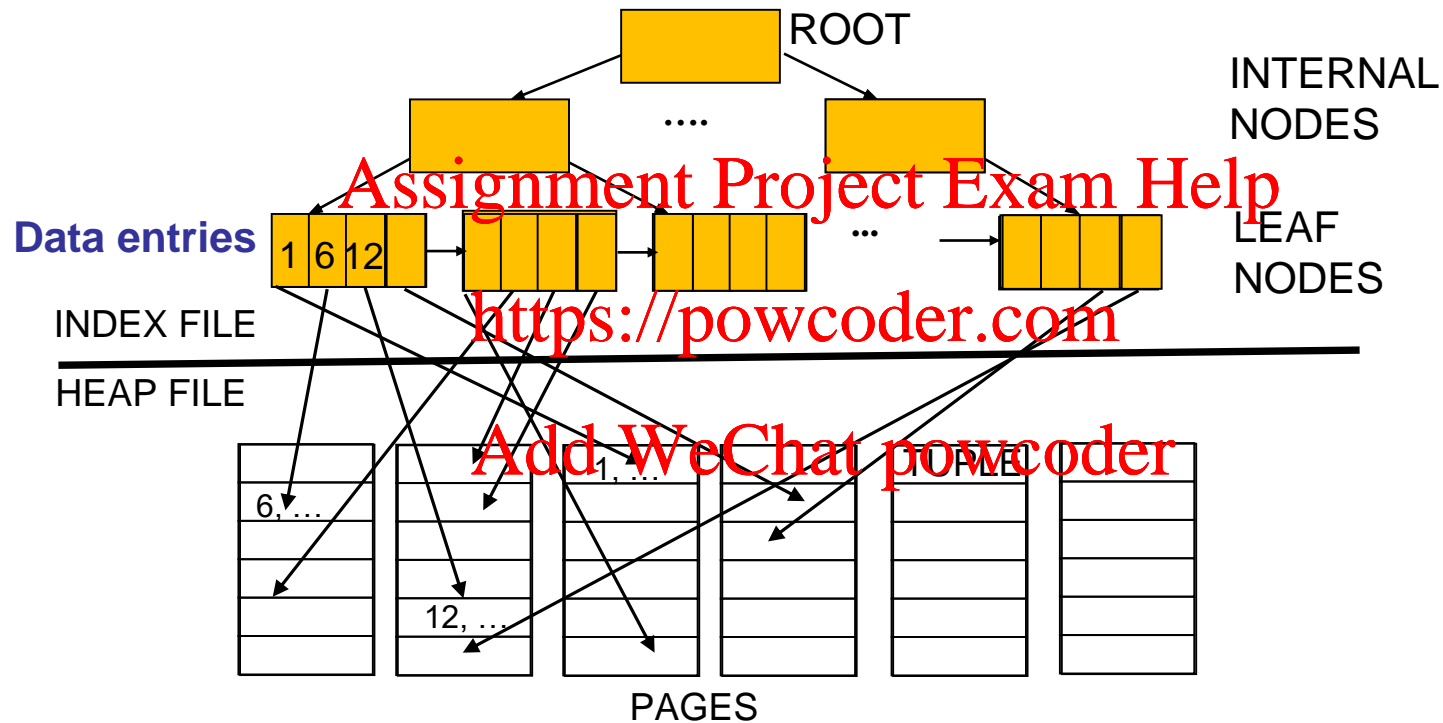

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- A data file can have a clustered index on at most **one search key combination** (i.e. we cannot have multiple clustered indexes over a single table)
- Cost of retrieving data records through index varies *greatly* based on whether index is clustered (cheaper for clustered)
<https://powcoder.com>
- Clustered indexes are *more expensive to maintain* (require file reorganization), but are really efficient for **range search**

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

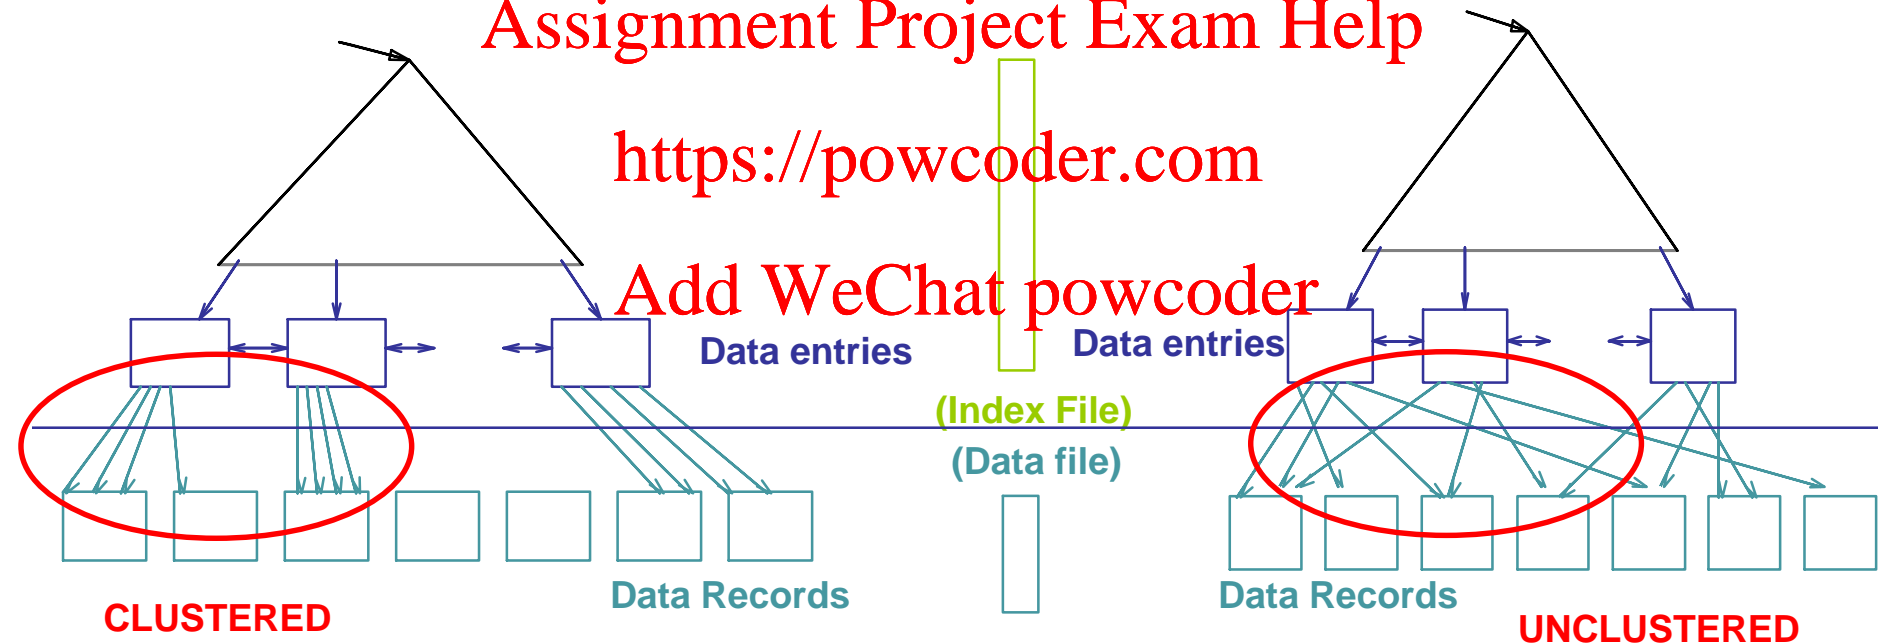

Clustered vs. Unclustered Index: Cost

- (Approximated) cost of retrieving records found in range scan:
 1. Clustered: cost \approx # **pages** in data file with matching records
 2. Unclustered: cost \approx # of matching index **data entries (data records)**

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- **Primary** index includes the table's **primary key**
- **Secondary** is any other index

- Properties: **Assignment Project Exam Help**
 - Primary index **never** contains duplicates
 - Secondary index **may** contain duplicates

Add WeChat powcoder

Composite Search Keys

- An index can be built over a combination of search keys
- Data entries in index sorted by search keys

• Examples:

1. Index on $\langle \text{age}, \text{sal} \rangle$
2. Index on $\langle \text{sal}, \text{age} \rangle$

3. Efficient to answer:
 age=12 and sal = 10
 age=12 and sal > 15

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- Hash-based index:

- Represents index as a collection of *buckets*. Hash function maps the search key to the corresponding bucket.

- $h(r.search_key) = \text{bucket in which record } r \text{ belongs}$

- Good for equality selections

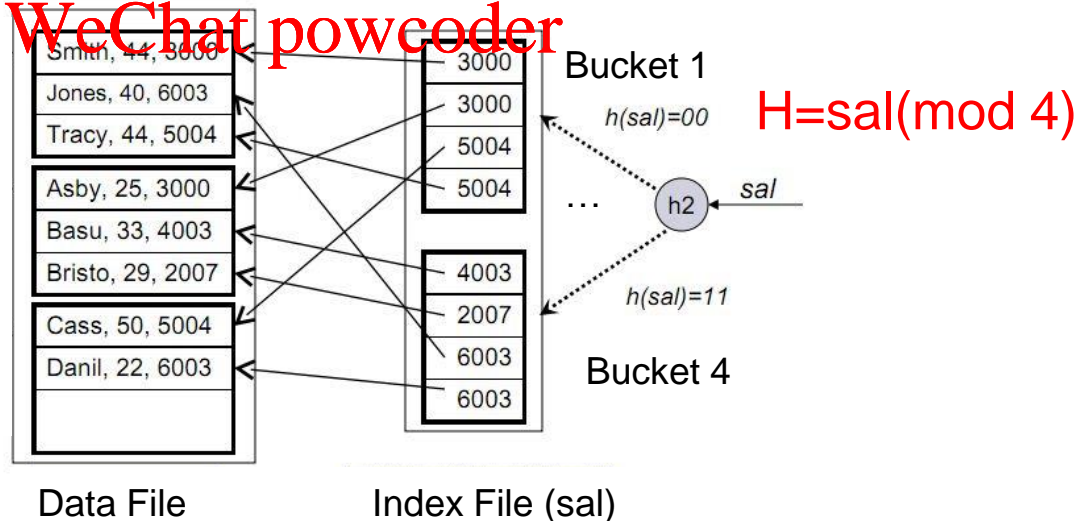

<https://powcoder.com>

- Example:** Hash-based index on (sal)

Add WeChat powcoder

Find Sal = 2007

$2007 \bmod 4 = 3$ go to Buck.4

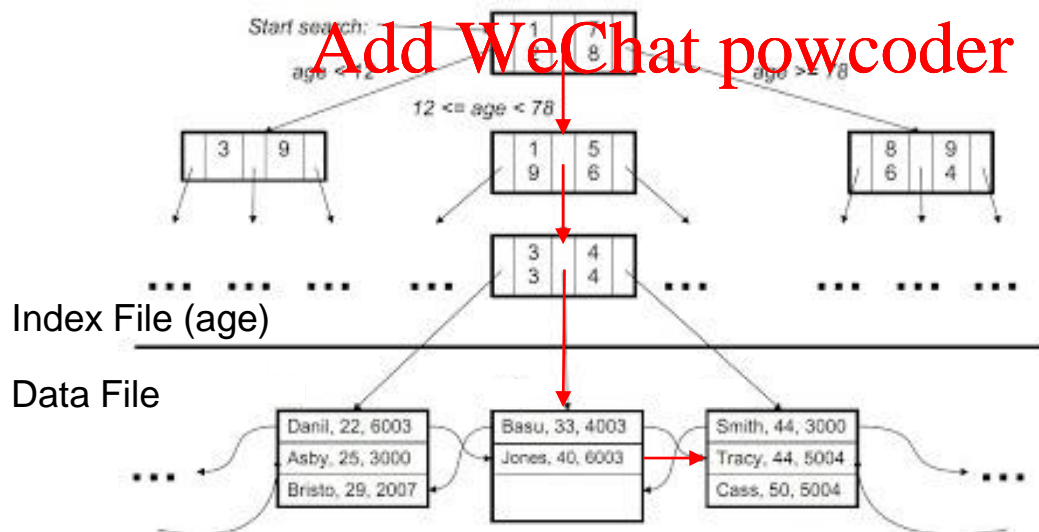

- Tree-based index:

- Underlying data structure is a binary (B+) tree. Nodes contain pointers to lower levels (search left for lower, right for higher). Leaves contain data entries sorted by search key values.

- Good for range selection

- So far we have shown those

- **Example:** Tree-based index on (age)

Add WeChat powcoder

<https://powcoder.com>

Assignment Project Exam Help

Find age > 39

- Many alternative file organizations exist, each appropriate in some situation
- If selection queries are frequent, sorting the file or building an *index* is important

Assignment Project Exam Help

- Index is an additional data structure (i.e. file) introduced to quickly find entries with given key values
 - Hash-based indexes only good for equality search
 - Sorted files and tree-based indexes best for range search; also good for equality search
 - Files rarely kept sorted in practice (because of the cost of maintaining them); B+ tree index is better

<https://powcoder.com>

Add WeChat powder

- Describe alternative file organizations
- What is an index, when do we use them
- Index classification
